

One-of-a-kind Environments for Customers who require 100% Availability of their IT & Business Systems

OneIT is a *leading provider* of highly customized BC / DR services across North America and offers one of the *most robustly connected* cloud platforms in the world.

Who is OneIT?

OneIT exists to help companies, large and small, create distinctive, robust, 100% available IT architectures for business continuity and disaster recovery that work seamlessly with their production environments. No lost data, no business interruption; just 100% performance through the unforeseen.

OneIT assembles brand neutral solutions that meet the needs of each client. Every solution we create integrates seamlessly into our client's existing architecture to meet their desired uptime requirements.

The environments that **OneIT** designs and implements are all custom per the client, their software, hardware, applications, file types, RTO/RPO timeframes, as well as budget demands.

OneIT combines best practices in architecture design and service delivery to create one-of-a-kind IT environments for discerning customers: Customers who require 100% availability of their IT and business systems.

Use Cases versus Big Box Cloud Providers

When it comes to moving critical IT infrastructure to the cloud, not all systems or applications are a good fit for the large providers. OneIT has expertise in customized uplift, and offers various advantages over hyper scaled cloud companies:

- ✓ Our solutions and network connectivity are highly customized
 - High compute applications that may not perform well over a long distance (due to latency) are engineered for optimized performance
 - Opens up the possibility to create an innovative & nimble primary cloud deployment, backup site, or combination of both (per app)
 - Purely internal applications can ride over private connections and stay internal without ever touching the public Internet
 - Mission critical applications and data that users cannot be without are automatically backed up based on the user's RTO/RPO timeframes to eliminate unexpected downtime. Backup methods and process are regularly tested to ensure performance when it matters most
- ✓ Secure environments
 - OneIT customizes security per application and can meet HIPAA, PCI, or other compliance criteria set forth by the user. Data is always encrypted; in every phase of its life cycle
- ✓ Our solutions are flexible
 - Temporary deployments/projects/test/dev environments that require a responsive environment to turn up/down are easily attainable in our cloud
 - No long term commitments for temporary projects; we flex with our client's ever-changing needs
